$\qquad$

Rotations, Reflections, and Translations of Geometric ShapesGuided Lesson Explanation:

## Explanation\#1

Step a: Draw the line segment between the vertex and the point of rotation.
Step b: Use a protractor to draw the angle of rotation.
Step c: Use a compass to mark the rotated vertex point on the other side of the angle.

Step d: Draw line segments connecting the rotated vertices.

In above diagram $S R=S^{\prime} R$ and $m$ angle $S R S^{\prime}=80^{\circ}$. So the correct answer is
A.

## Explanation\#2

A reflection flips the figure over a line to create a mirror image.
Figure c is reflection because it is exactly mirror image.
$\qquad$

So the answer is c

## Explanation\#3

Step a: Draw the line segment between the vertex and the point of rotation.
Step b: Use a protractor to draw the angle of rotation.
Step c: Use a compass to mark the rotated vertex point on the other side of the angle.

Step d: Draw line segments connecting the rotated vertices.

In above diagram $\mathrm{FG}=\mathrm{F}^{\prime} \mathrm{G}^{\prime}$ and angle $\mathrm{FGF}^{\prime}=70$ ㅇㅇ $o$ the correct answer is
B.
