## **Visual Estimation-Guided Lesson Explanation**

I like to create little books that I can fit a fixed number of items in and then count the total number of blocks to make a quick estimate as to the size of the total number of objects.

#### Explanation#1

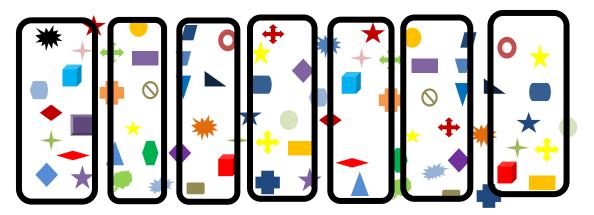

In this case I work with blocks of 5 objects. I count how many total blocks I have and times that by 5.

In this case there are a few left overs.

5 objects/block x 7 blocks = 35 objects That fits choice b.

### Explanation#2

This is very big. I'll use blocks of 10.

10 objects/block x 7 blocks = 70 objects That fits choice c.

# Explanation#3

I'll revert back to use block of 5 again.

5 objects/block x 3 blocks = 15 objects That fits choice a.
