## Similarity Transformations - Step-by-Step Lesson

You can transform  $\Delta$ EFG to  $\Delta$ E'F'G' by translating it and then performing dilation centered at the origin. So,  $\Delta$ EFG ~  $\Delta$ E'F'G'. Find the translation rule and the scale factor of the dilation.

## Explanation:

Step 1) The origin is the point (0, 0).

The image of the point (x,y) translated h units horizontally and k units vertically is (x+h,y+k). If h is positive the point is translated to the right and if h is negative the point is translated to the left. If k is positive the point is translated up and if k is negative the point is translated down.

The image of the point (x,y) dilated with a scale factor of s centered at the origin is (sx,sy).

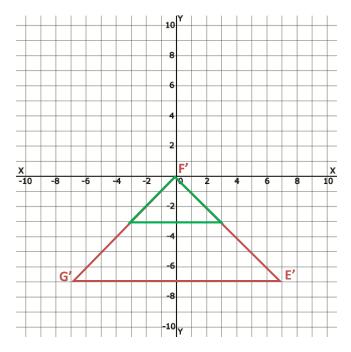

Since the dilation is centered at the origin, make sure that one pair of corresponding vertices is located at the origin before you apply the dilation. This makes sure that the dilation will not affect the coordinates of these points. (In general, it is always the case that the center of the dilation is not affected by the dilation.)

Name

Step 2) From the diagram, you can see that F' is already locked at the origin. So, find the translation that maps F(-3, -7) to F' (0, 0).

Step 3) To translate F (-3, -7) to F' (0, 0), move 3 units to right and 7 units up. So, the translation that maps F to F' is given by the rule  $(x, y) \rightarrow (x+3, y+7)$ . Next, apply this translation rule to the three vertices of  $\Delta$ EFG. The image of F is F', the image of EF lies on top of E'F', and the image of FG lies on top of F'G'.

Step 4) Now, find the scale factor of the dilation that will expand the image of  $\Delta$ EFG onto  $\Delta$ E'F'G'. Choose a pair of corresponding vertices not located at the origin, like (3, -3) and the image of E after the translation, which is E' (7, -7).

Step 5) Calculate the ratio of the x-coordinates or the ratio of the ycoordinates. For instance, the ratio of the x-coordinates is 7/3= 2.3, so the scale factor of the dilation that maps (3, -3) onto E' (7, -7) is 2.3. This dilation also map the image of G, which is (-3, -3), onto G' (-7, -7) and fixes both F and F'

Step 6) In the summary, the translation and scale factor are:

Translation:  $(x, y) \rightarrow (x+3, y+7)$ 

Scale Factor: 2.3
