## Fractions to Mixed Numbers- Step-by-Step Lesson

Write the fraction as a mixed number in the simplest form.

$$\frac{15}{6}$$

**Explanation:**

A mixed number is a whole followed by a regular fraction.  In this case, we are given an irregular fraction (top heavy).

We have to divide 15 ÷ 6 to see how many whole numbers exist.

$$6\overline{)15}(2$$
$$\underline{12}$$
$$3$$

Now, we will write 2 and then write the remainder value i.e. 3 and at last we write the denominator value i.e. 6.

So we will write it like this:

$$2\frac{3}{6}$$
