# Rewriting Multiplication Lesson
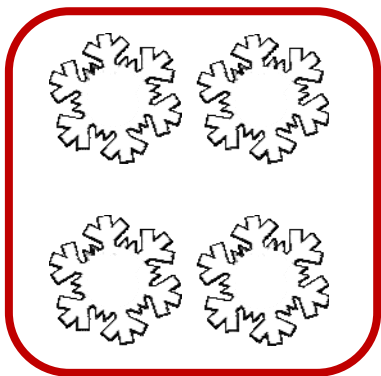

Rewrite the array as a multiplication problem as a multiplication problem.

Explanation: This is a simple multiplication problem. A multiplication problem consists of three things:

a) the number of factors present

b) the value of those factors

c) place a product symbol (●) between all the factors.

a) How many factors are present?
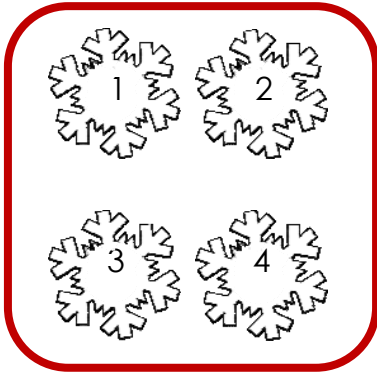

Factor 1   Factor 2

b) What are the values of the factors?

Factor 1 = 4

Factor 2 = 6

c) We now know that we have the two factors 4 and 6. The only thing left to place a product symbol between the factors.

$$4 \bullet 6$$
