Mixed Basic Operations Word Problems - Step-by-Step Lesson

John is running an ice cream parlor. Each day, John orders cups that hold the ice cream based on his number of sales the day before.

He purchased 135 ice cream cups on Wednesday. On Thursday, he purchased another 84 cups. How many cups did John purchase in total?

Explanation:

For the total number of cups, we have to add purchased cups:

Wednesday: 135 + Thursday: 84 = 219 cups

So, the answer is 219 cups.
